1. Google Search

Given the rising amount of information and resources available online, as well as the simplicity and accessibility of using a search engine to discover what you need, Google Search has become an increasingly crucial tool for translators in recent years. However, some people might not utilize it to its full potential simply because they don't know how to do so. This lack of knowledge includes things like not understanding how to use **basic search tools**, **search operators**, and **advanced search** features, as well as assessing the reliability of search results.

This article aims to equip you with the information and abilities needed to utilize Google Search efficiently, which will make you better at searching, whether you are an editor, reviewer, or even an annotator.

1.1. Basic Search Tools

When you're doing a basic Google search you can use two (or even four) simple tools to help you restrict the scope of your research. To do so, you must first look for something on Google's search engine. When you do, the "Tools" option will be shown under the right-hand corner of the search bar. If you select it, multiple additional choices will appear below the search bar (where the amount of search results usually is).

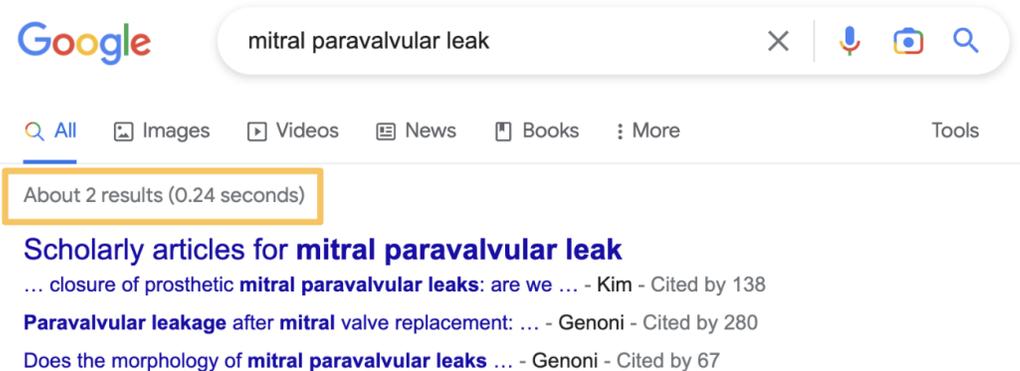

These four options are: **(1)** Any time, **(2)** All results, **(3)** Any country, and **(4)** Any language. All of these will be further explained in the following examples.

1.1.1. Any time

This filter gives you the option of selecting a time range for your search results, such as the previous day, week, month, year, or a custom range. This might be useful for finding current articles or websites on a specific topic.

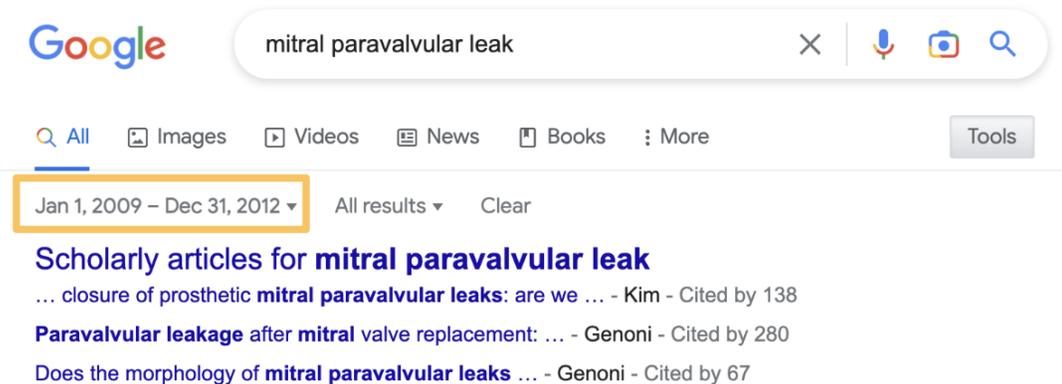

For example, say you wish to search for **“mitral paravalvular leak”**. A simple Google Search will yield a significant number of results since these include any website, from any time, that features the term **“mitral paravalvular leak”**. However, if you apply the filter “Any time”, and modify it to, say, the previous 24 hours, you will get fewer results.

Google search interface for the query "mitral paravalvular leak". The search bar contains the query. Below the search bar, navigation links for "All", "Images", "Videos", "News", "Books", and "More" are visible. A yellow box highlights the text "About 2 results (0.24 seconds)". Below this, the heading "Scholarly articles for mitral paravalvular leak" is shown, followed by three search results:

- ... closure of prosthetic **mitral paravalvular leaks**: are we ... - Kim - Cited by 138
- Paravalvular leakage** after **mitral** valve replacement: ... - Genoni - Cited by 280
- Does the morphology of **mitral paravalvular leaks** ... - Genoni - Cited by 67

You may also use the calendar function to specify a custom range. For example, if you enter the dates 2009 to 2012, you will only see results for **“mitral paravalvular leak”** from January 1st, 2009 to December 31st, 2012. Consequently, this will also yield a smaller number of results than your initial search.

Google search interface for the query "mitral paravalvular leak". The search bar contains the query. Below the search bar, navigation links for "All", "Images", "Videos", "News", "Books", and "More" are visible. A yellow box highlights the date range filter "Jan 1, 2009 – Dec 31, 2012". Below this, the heading "Scholarly articles for mitral paravalvular leak" is shown, followed by three search results:

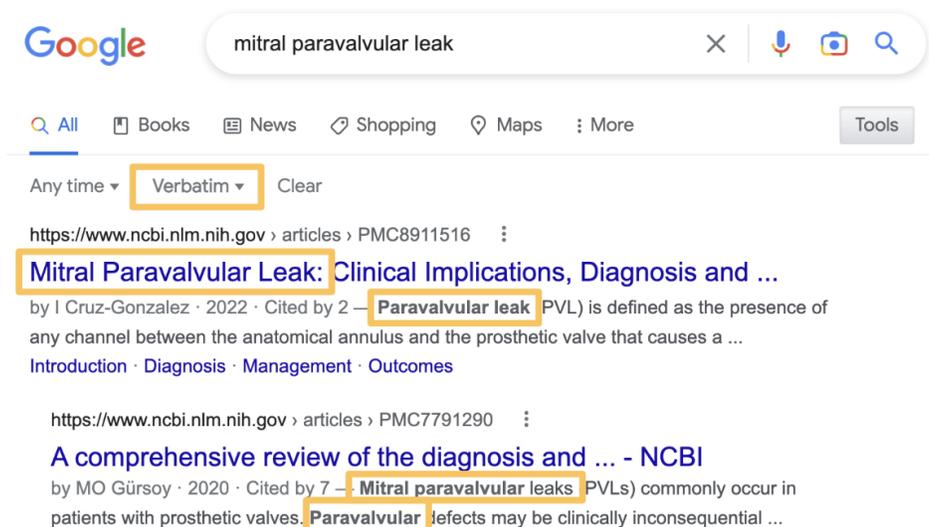

- ... closure of prosthetic **mitral paravalvular leaks**: are we ... - Kim - Cited by 138
- Paravalvular leakage** after **mitral** valve replacement: ... - Genoni - Cited by 280
- Does the morphology of **mitral paravalvular leaks** ... - Genoni - Cited by 67

This can also be done through the use of **“Last update”** in [Advanced Search](#).

1.1.2. All results

This option enables you to choose between “All results” and “Verbatim”. By selecting “Verbatim”, you will bypass Google’s algorithm and be shown only pages that include the precise words you’ve looked for.

For instance, using the prior example, if you search for **“mitral paravalvular leak”**, you will find many results. Most of these, however, just contain a portion of the words you were searching for. Nonetheless, if you apply the “All results” filter and switch it to “Verbatim”, you will only see pages that contain every term you were searching for. Naturally, you will also get fewer results.

But while this option will display web pages containing all the words you’ve entered, they might not be in the order you desire them to appear. This can be done through the use of the **Exact Match** operator or **“This exact word or phrase”** in **Advanced Search**.

How to unlock the last two tools...

The last two options will only appear if your region and language match the website’s version. For example, if you’re using Google’s Portuguese version (which is <https://google.pt>), your region must be (or be set to) Portugal and your language to be European Portuguese. To do this, start by doing a search. Then, locate the “Settings” icon in the top right corner of the screen.

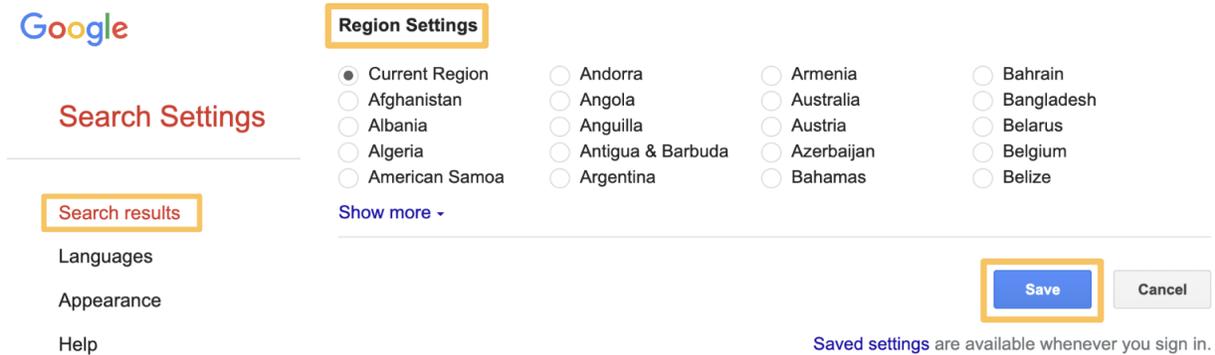

Clicking on it will reveal a menu with a “Languages” option, under the “Using Search” section. Selecting this option will take you to a different page where you can specify the desired language, in this case, European Portuguese.

You can also define the country in the menu on the left, by selecting the first option, “Search results”, and then scrolling down to “Region Settings”. In this example, the region will be set to Portugal.

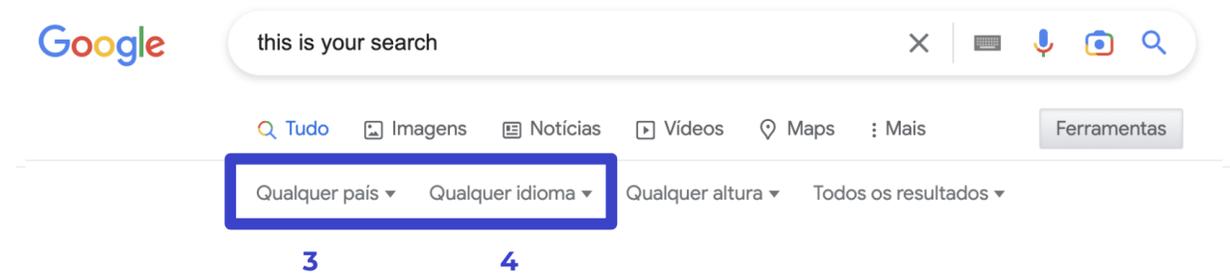

Finally, don't forget to save your changes before continuing your search, by pressing the "Save" button at the bottom of the page. This must be done two times: when you change the language and when you alter the region.

The screenshot shows the Google Search Settings page. On the left, there is a sidebar with 'Search results' highlighted. The main content area is titled 'Region Settings' and contains a list of countries with radio buttons. The 'Current Region' option is selected. Below the list is a 'Show more' link. At the bottom right, there is a blue 'Save' button and a grey 'Cancel' button. A note at the bottom right states: 'Saved settings are available whenever you sign in.'

It is also important to mention that this isn't restricted to the country you're currently in, meaning that if you're living in, say, Portugal, you can still do this to use the Japanese version of Google.

After you follow these steps and use the version of Google of the language and country you've defined, you will find these two additional options:

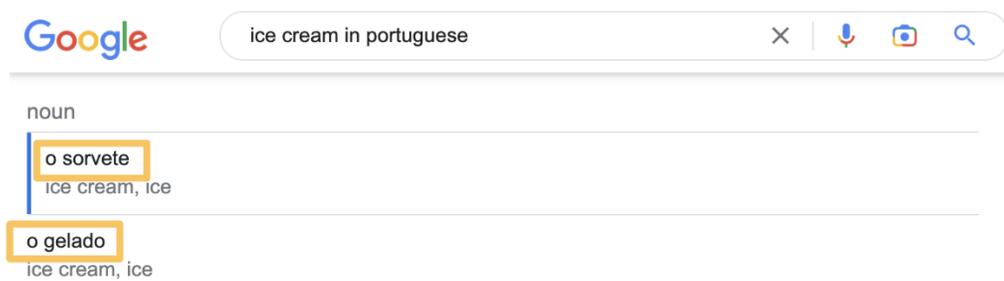

The screenshot shows the Google search results page. The search bar contains the text 'this is your search'. Below the search bar, there are navigation links for 'Tudo', 'Imagens', 'Notícias', 'Vídeos', 'Maps', and 'Mais'. A 'Ferramentas' button is also visible. At the bottom, there are two dropdown menus: 'Qualquer país' and 'Qualquer idioma'. The numbers '3' and '4' are placed below these dropdowns respectively.

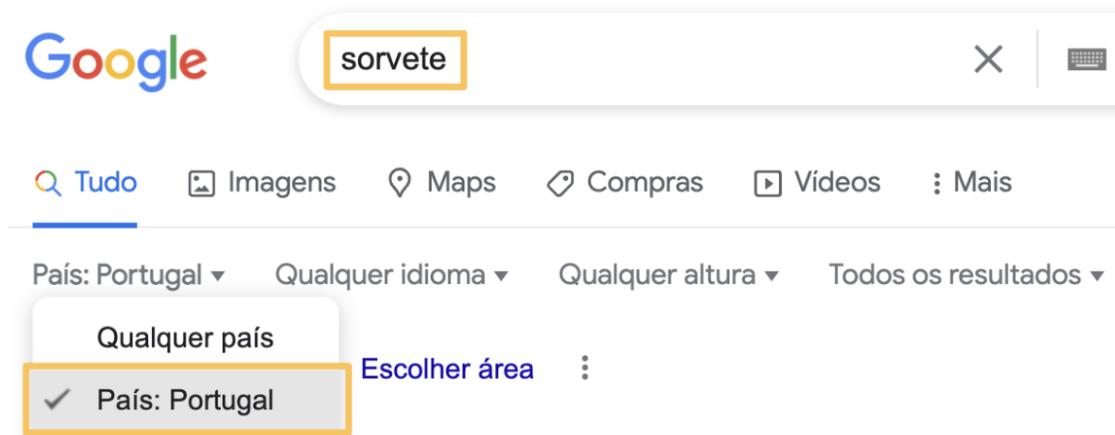

1.1.3. Any country

Occasionally, it becomes necessary to investigate the translation of a certain word or phrase, in a specific country. Particularly when translating into a language that has multiple varieties. The "Any country" option can be utilized to accomplish this task.

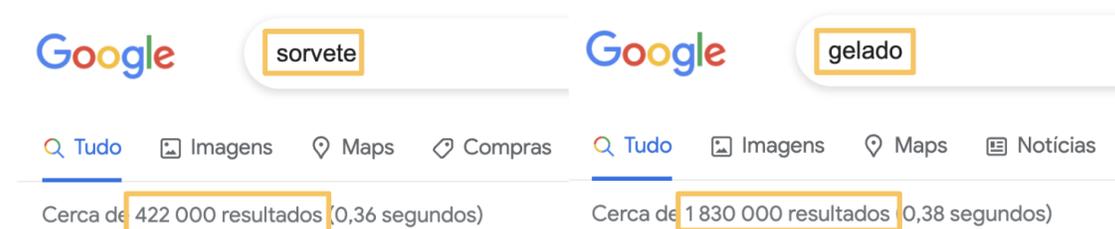

For example, imagine you wish to determine the translation of "ice cream" in European Portuguese. If you search for something like "ice cream in portuguese", you will get two distinct results, namely, "sorvete" and "gelado".

To find out which one is more commonly used in Portugal, you can use the “Any country” option. You can do this by searching for each one of these words separately, while also choosing Portugal as the region in the “Any country” drop-down menu.

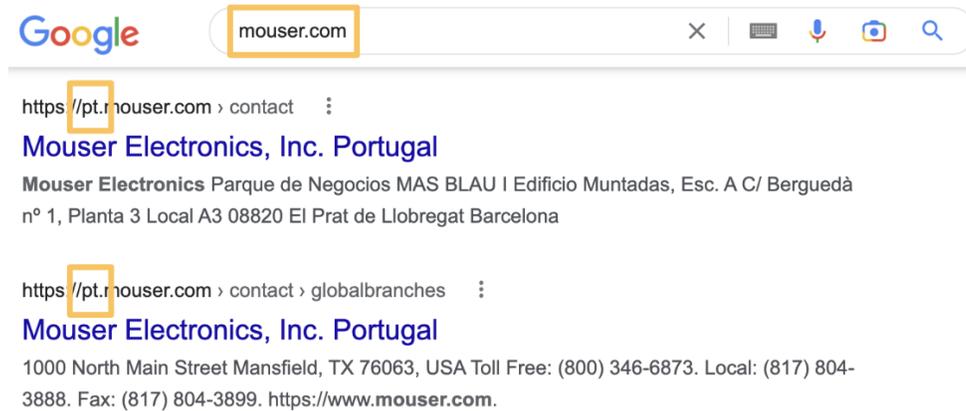

From the results, you will see that the second word (“gelado”) has more hits in Portugal, which may suggest that it is the more commonly used term for “ice cream” in that country. However, it is important to be cautious when doing this search, as a single word may have multiple meanings, which can affect the number of results.

Moreover, you can also use this option to search for a specific version of a particular website. For example, if you want to find Mouser Electronics’ Portuguese version, you can type the general website’s URL, in this case, “mouser.com”, and then select “Portugal” in the “Any country”

drop-down menu. Doing this will give you the Portuguese version of the website which is identifiable by its ISO code (more about this in [Domain Search](#)), in this case, “pt”.

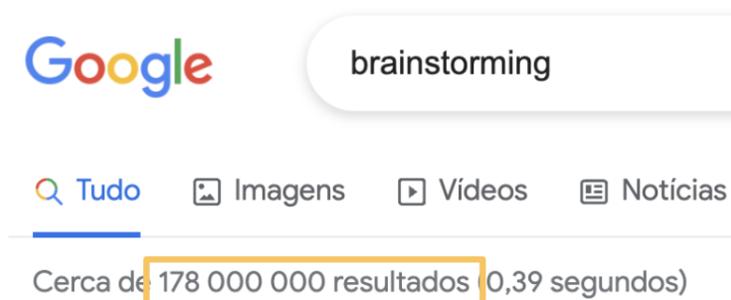

This can also be done through the use of the [Domain Search](#) operator or the “[Site or domain](#)” and “[Region](#)” options in [Advanced Search](#).

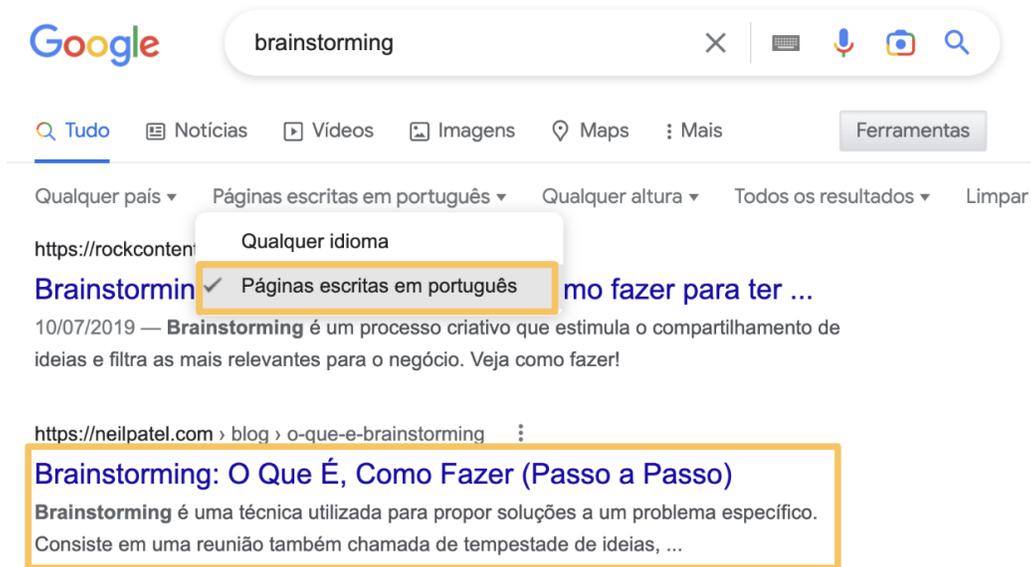

1.1.4. Any language

As a translator, you’ll spend a significant amount of time not only searching for terms and information in their original language but also in the language into which you’re translating a certain text, you can use this option to pick the language in which you want your results to appear.

For example, imagine you search for the word “brainstorming”. You will obtain a large number of results since they contain pages not only in English but also in other languages.

If you wish to search for “brainstorming” in, say, Portuguese, you may first type the word and then pick “Portuguese” from the “Any languages” drop-down menu, and you will not only obtain fewer results but all of them will be in Portuguese.

Brainstorming é uma técnica utilizada para propor soluções a um problema específico. Consiste em uma reunião também chamada de tempestade de ideias, ...

Similarly to the previous “Any country” option, this one also allows you to restrict your website results but, in this case, to a specific language. Using the prior example, if you want to find Mouser Electronics’ website in Portuguese, you can type the URL, “mouser.com”, and then select “Only pages in Portuguese”, from the “Any language” drop-down menu. However, this search will yield two versions of the website, in this case, the Portuguese and the Brazilian versions. This happens because the Portuguese language has multiple varieties. Consequently, you must be careful and do your research accordingly.

This can also be done through the use of [Domain Search](#) operator or the “[Language](#)” option in [Advanced Search](#).

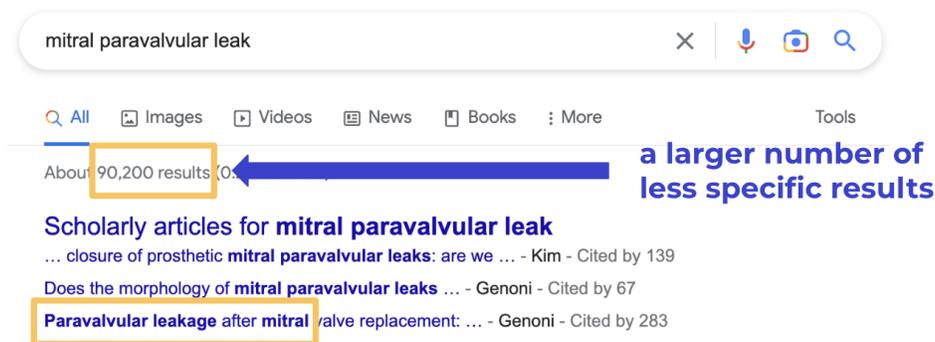

1.2. Search Operators

Google Search operators are special characters or commands that you can use to refine your search results. As a translator, these can be extremely useful when it comes to identifying relevant resources to aid your work and increase your translation speed.

These operators will be explained in-depth in the following list. However, if you prefer a broader overview of every search operator, you can see the [Search Operators Table](#).

1.2.1. Exact Match

Oftentimes while researching it is necessary to find information about a specific string of words. For example, as mentioned in the [Any time](#) Basic Search Tool, if you search for “**mitral paravalvular leak**”, the results you get might only include one of these words. This, of course, creates a wider range of results and, consequently, makes it harder for you to obtain the exact match to what you are looking for.

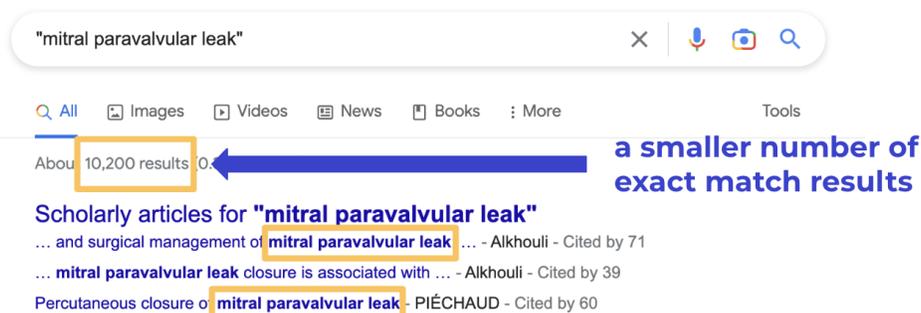

However, if you use **quotation marks ("") before and after the words**, you'll only get results that feature what you've searched for and in that same order. Your search should look something like this:

EXAMPLE

→ “mitral paravalvular leak”

Important: there shouldn't be any whitespaces between the **quotation marks ("")** and the first and last word you type. The group of words you want to search for must be inside the **quotation marks ("")**.

To search for **multiple exact matches simultaneously**, see [Multiple Search](#).

Exact matches can also be found through the use of the **"All results"** feature in [Basic Search Tools](#) (by selecting "Verbatim") or **"This exact word or phrase"** in [Advanced Search](#).

1.2.2. Multiple Search

There are instances when, for example, looking for multiple exact matches (to know more see [Exact Match](#)) might be essential for your research. This may be the case if you want to **locate different terminology within the same text or even verify if a certain thing has several designations**. There are two ways of doing this depending on your needs: **(1)** if you want two (or more) exact matches at the same time or **(2)** to get one exact match or another.

For the first case, you can either use capitalized **AND** between exact match searches (example **1a**) or you can forgo the **AND** and simply use quotation marks (" ") for each group of words you want to search (example **1b**). If you need to find one term or another, you can use capitalized **OR** between each exact match search (example **2**). To do this, you can also use a **vertical line (|)** where the **OR** would be (example **2b**).

EXAMPLE

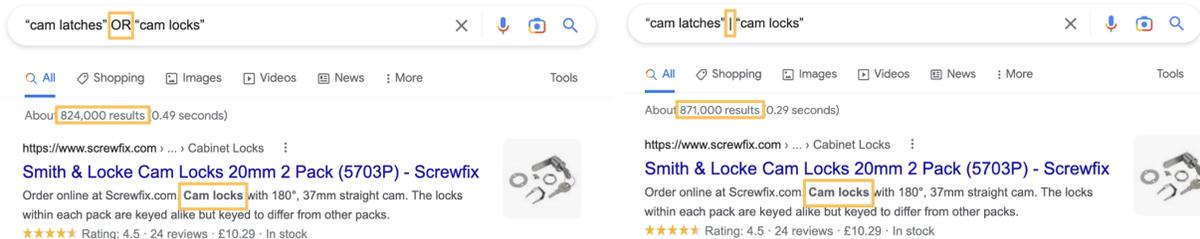

→ **(1)** Two (or more) exact matches

- ◆ **(a) "mitral paravalvular leak" AND "aortic paravalvular leak"**
- ◆ **(b) "mitral paravalvular leak" "aortic paravalvular leak"**

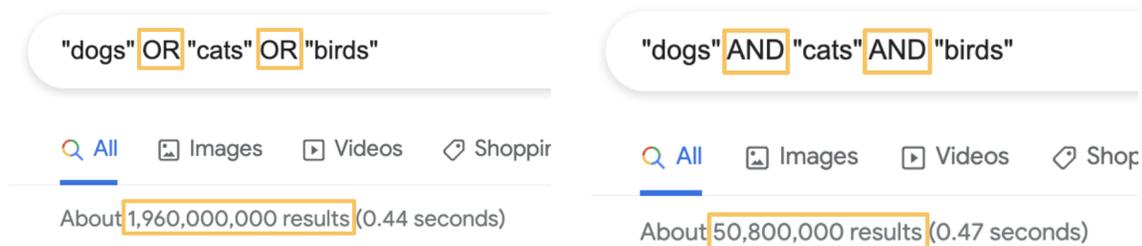

→ **(2)** One exact match or another

- ◆ (a) “cam latches” OR “cam locks”
- ◆ (b) “cam latches” | “cam locks”

Important: there shouldn't be any whitespaces between the quotation marks (“ ”) and the first/last letters of the words you type. Moreover, the **OR/AND** should always be capitalized, placed outside of the quotation marks (“ ”) and between each exact match search.

Both these types of search are not confined to only two groups of words. For example, if you want to search for three terms while using the **OR** operator, you just need to do the following: **“cats” OR “dogs” OR “birds”**. The same logic applies to the **AND** operator.

The second type of search (**OR** operator) can also be done by utilizing the **“Any of these words”** option in **Advanced Search**.

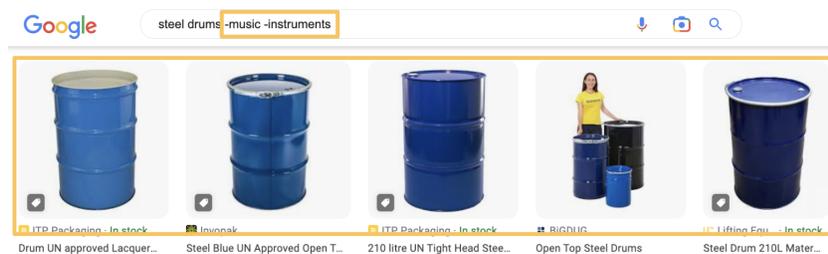

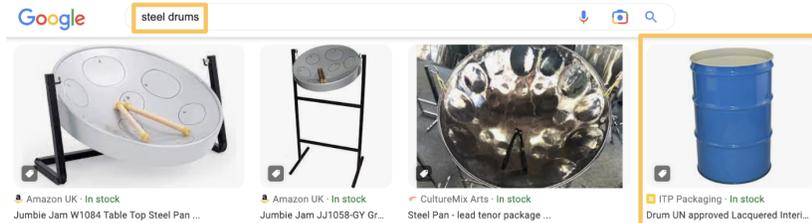

1.2.3. Exclude Content

Occasionally there is a need to remove some unrelated content or even unnecessary websites. This can be particularly useful when a word has multiple meanings or when a certain website clogs up your search. To do so you must use a **hyphen (-)** before the content you wish to remove. Moreover, for searches where you want to exclude verbatim, it **must be used together with the Exact Match operator** mentioned above.

EXAMPLE

→ Words

◆ steel drums -music -instruments

→ Verbatim

◆ sandman -"neil gaiman"

Google search for "sandman". Results include: [https://en.wikipedia.org/wiki/The_Sandman_\(TV_series\)](https://en.wikipedia.org/wiki/The_Sandman_(TV_series))
The Sandman (TV series) - Wikipedia
 The Sandman is an American fantasy drama television series based on the 1989–1996 comic book written by Neil Gaiman and published by DC Comics.

How to Plant, Grow, and Care for Tulip Flowers
 Tulip flowers may be single, double, ruffled, fringed, or lily-shaped, depending on the variety. Wild—or "Species"—tulips are small in size, ranging in height ...

Important: there shouldn't be any whitespaces between the **hyphen (-)**, the quotation marks (" ") (if you use them), and the word/website you wish to exclude. If

you wish to exclude multiple words, every one of them must be preceded by a **hyphen (-)**.

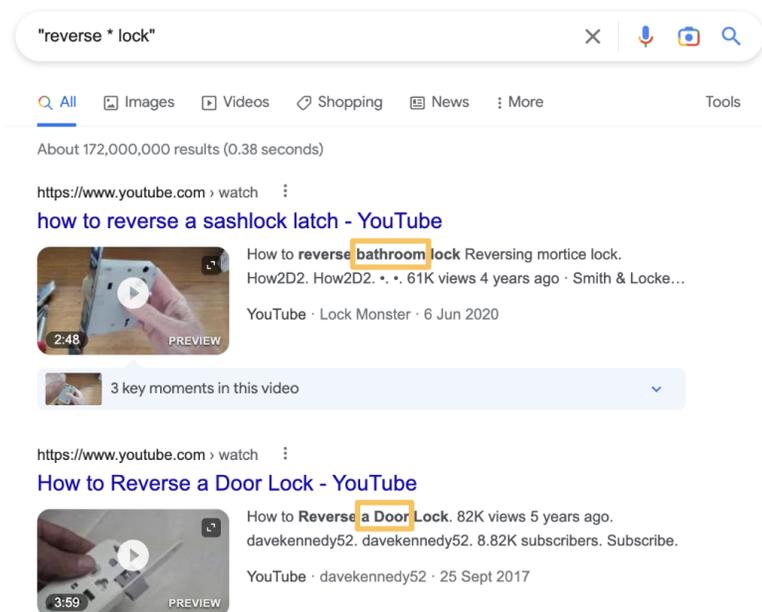

This can also be done by using the “[None of these words](#)” option in [Advanced Search](#).

1.2.4. Partial Search

There might be a time when you’re researching something very specific but you can’t remember part of it or even want to simply see what other options might exist. To do so, you can use an **asterisk (*)** between the words you do remember/want to search. Nevertheless, for this search operator to work properly, it **must be used together with the [Exact Match](#) operator** mentioned above.

EXAMPLE

→ “reverse * lock”

Important: the **asterisk (*)** must be placed in the space where the word you don’t know would be. Moreover, there shouldn’t be any whitespaces between the first/last letters of the words you type.

1.2.5. Proximity Search

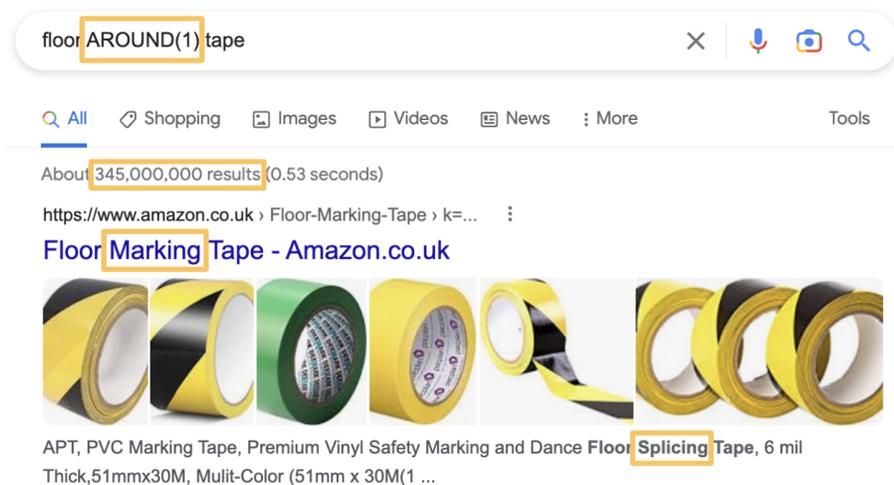

If you don't want to do an exact search or you don't remember all the words to what you're looking for you can use the Proximity Search operator. Similarly to the [Partial Search](#) operator mentioned above, this one enables you to conduct a search without knowing all the words. However, **this operator lets you define the number of words between the (at least) two words you do remember**. To do so, you should type the first word, followed by **AROUND(number of words in between)** and then the last word.

For example, if you're looking for "floor marking tape" and you can't remember the word "marking" but you still know there was only one word between "floor" and "tape", your search should look like this:

EXAMPLE

→ **floor AROUND(1) tape**

Important: **AROUND** should be capitalized and there can't be any whitespaces between **AROUND**, the number, and the parentheses.

The example above will give you results where the words "floor" and "tape" are one word apart. If you know that there is more than one word between what you want to search you should change the number between parentheses to the corresponding number of words (e.g. AROUND(2), AROUND(3), ...).

1.2.6. Domain Search

When **researching something related to a particular client**, it is important to first check **how the content is translated and described on their own website**. However, oftentimes it can

be difficult to locate what you are looking for inside the client's website due to the lack of a search bar or simply because of its complex layout.

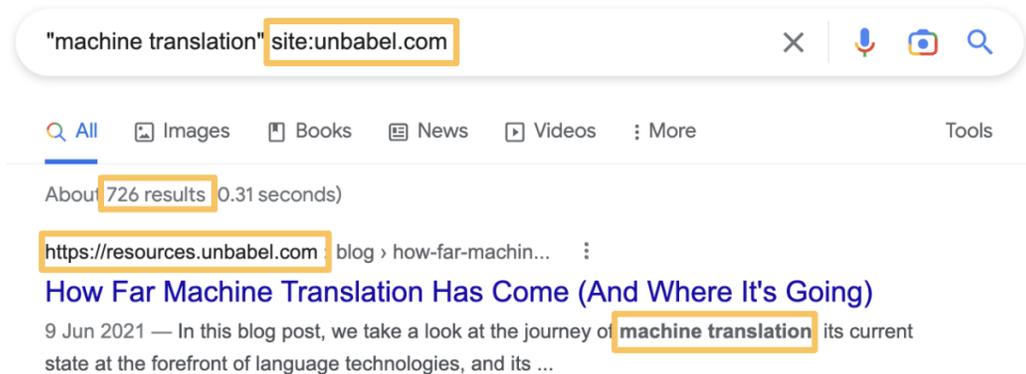

Nonetheless, this is possible to do through Google Search, with the help of the **Domain Search operator**. To do so, you should type **site:** followed by the URL of the client's website. Moreover, for this search operator to work properly, it **must be used together with the [Exact Match](#)** operator mentioned above.

The end result should look something like this:

EXAMPLE

→ **"machine translation" site:unbabel.com**

Important: don't leave any whitespaces between **site:** and the URL.

This can also be done by using the **"Site or domain"** option in [Advanced Search](#).

If you want to use this operator to search for something inside **more than one website**, combine it with the **OR operator** mentioned above in the [Multiple Search](#) section. **However, it is recommended to do each search individually**, since the order of results may primarily focus on the most popular website.

EXAMPLE

→ **"machine translation" site:unbabel.com OR site:youtube.com**

EXAMPLE

- English
 - ◆ **“cables and wires” site:mouser.com**
- Spanish (Spain)
 - ◆ **“cables y alambres” site:es.mouser.com**
- Spanish (Uruguay)
 - ◆ **“cables y alambres” site:uy.mouser.com**

Nuevos Cables y alambres - Mouser Electronics Uruguay

Nuevos Cables y alambres disponibles en Mouser Electronics. Conozca más sobre nuevos Cables y alambres en Mouser Electronics.

Important: the different website versions are usually identifiable by the use of the corresponding [country's ISO code](#) or even [language ISO code](#). Their format and position in the URL change according to each website. As before, you shouldn't leave any whitespaces between **site:** and the URL.

This can also be done by using the **“Region”** or the **“Language”** options in [Advanced Search](#).

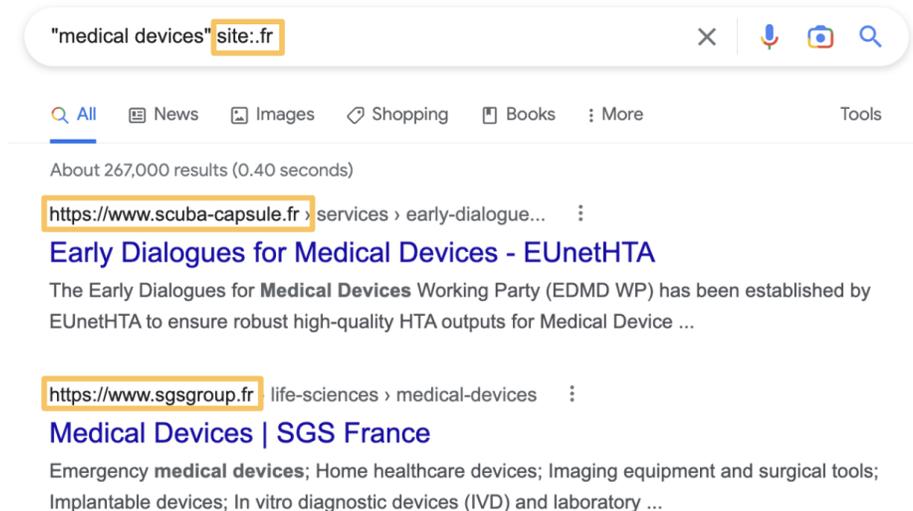

As mentioned, sometimes websites have different versions for each country or language, and those are defined by the use of the corresponding ISO code. Consequently, **there are also different standard domain suffixes for each country** (e.g. “.kr” for South Korea and “.nl” for the Netherlands). While there are times when even an official website might have a different suffix from the country’s standard, it might be sometimes useful to filter your results using these. To do so, you should type **site:**, followed by a **dot** and the **country’s standard domain suffix**.

EXAMPLE

→ France

◆ “medical devices” site:.fr

Important: don’t leave any whitespaces between **site:**, the dot and the domain suffix.

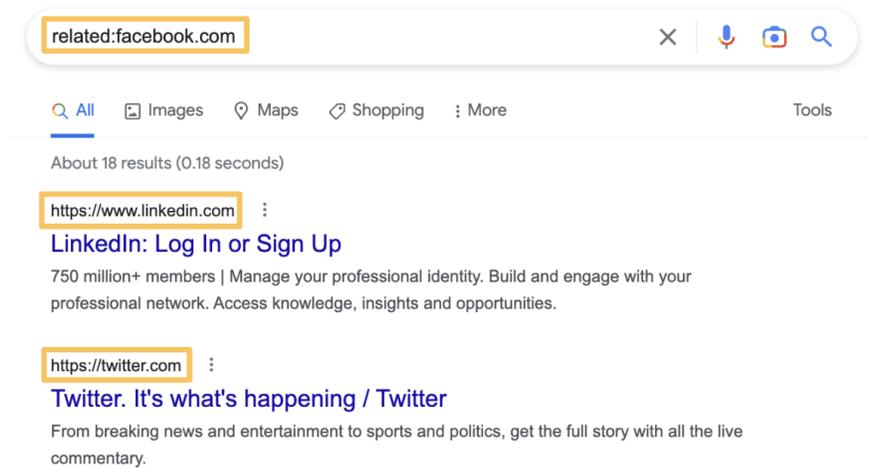

This can also be done by using the “[Region](#)” option in [Advanced Search](#).

1.2.7. Related Websites

There are occasions when you need information about a particular subject matter but can't seem to find it on the client's website. Other times you just want to see how something is translated and/or used in similar sources. To **find other websites that deal with the same subject as the client's** you can use the **Related Websites** operator. To do so, you should type **related:** followed by the URL of the website.

EXAMPLE

→ related:website.com

Important: don't leave any whitespaces between **related:** and the URL. Moreover, you can only use this for websites (e.g. typing "facebook" after **related:** wouldn't work).

1.2.8. Content Placement

Sometimes when you perform a search, you receive a seemingly endless list of results, but the word(s) you were looking for only appear in a particular area of the website, like the title or the URL. The following **Content Placement** operators should be used if you want to specify where the information you're looking for should appear. Moreover, if you want to search for verbatim, you must use this operator together with the **Exact Match** operator mentioned above, namely, the quotation marks (" ").

1.2.9. Title Search

When the search results show the words in the title.

EXAMPLE

- One word
 - ◆ **intitle:fastener**
- Multiple words
 - ◆ **allintitle:fastener assortments**
- Verbatim (multiple words in that particular order)
 - ◆ **allintitle:"fastener assortments"**

intitle:fastener

https://en.wikipedia.org › wiki › Fastener

Fastener - Wikipedia

A fastener (US English) or fastening (UK English) is a hardware device that mechanically joins or affixes two or more objects together.

Snap fastener · Brass fastener · Cleco (fastener) · Clevis fastener

allintitle:fastener assortments

https://www.orbitalfasteners.co.uk › Fasteners › Fasteners

Fastener Assortments

Various fastener assortment kits including screws, nuts, bolts and washers. Next day delivery available from Orbital Fasteners.

Important: there shouldn't be any whitespaces between **intitle:** or **allintitle:** and the word(s) or quotation marks (" ").

1.2.10. URL Search

When the search results show the words in the URL

EXAMPLE

- One word or not verbatim
 - ◆ **inurl:electrical**
- Multiple words
 - ◆ **allinurl:electrical enclosures**
- Verbatim (multiple words in that particular order)
 - ◆ **allinurl:"electrical enclosures"**

inurl:electrical

https://www.diy.com › electrical security › DIY763595

Home Electrical | DIY at B&Q

Important: there shouldn't be any whitespaces between **inurl:** or **allinurl:** and the word(s) or quotation marks (" ").

1.2.11. Text Search

When the search results show the words in the text

EXAMPLE

- One word or not verbatim
 - ◆ **intext:paddle**
- Multiple words
 - ◆ **allintext:paddle latches**
- Verbatim (multiple words in that particular order)
 - ◆ **allintext:"paddle latches"**

The screenshot shows two search results. The first result is for the search query 'intext:paddle', showing a snippet from Cambridge Dictionary: 'PADDLE | English meaning - Cambridge Dictionary' with a definition and a picture of a paddle. The second result is for 'allintext:paddle latches', showing a snippet from 'Locking Paddle Latches from Metrol' with a picture of a paddle latch.

Important: there shouldn't be any whitespaces between **intext:** or **allintext:** and the word(s) or quotation marks (" ").

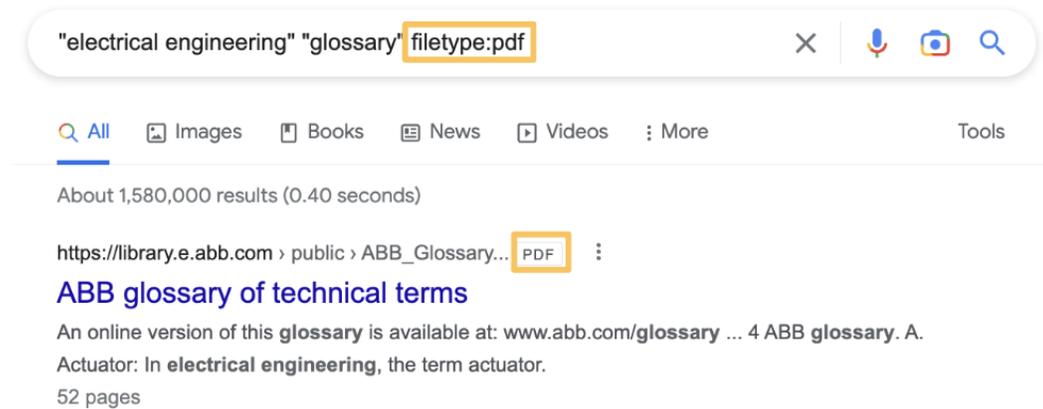

All of these can also be done by using the "**Terms Appearing**" option in **Advanced Search**.

1.2.12. File Type Search

It is frequently necessary to search for articles on a specific subject or even glossaries on that topic. Many of these are stored in singular files and can be challenging to find because they are typically hidden behind countless pages on a single website. To facilitate your research you can use this operator by typing **filetype:** followed by the shortened file type you are looking for. Nevertheless, for this search operator to work properly, it **must be used together with the Exact Match** operator mentioned above.

EXAMPLE

→ "electrical engineering" "glossary" filetype:pdf

"electrical engineering" "glossary" filetype:pdf

Q All Images Books News Videos More Tools

About 1,580,000 results (0.40 seconds)

https://library.e.abb.com › public › ABB_Glossary... PDF :

ABB glossary of technical terms

An online version of this **glossary** is available at: www.abb.com/glossary ... 4 ABB **glossary**. A.
Actuator: In **electrical engineering**, the term actuator.
52 pages

Important: there shouldn't be any whitespaces between **filetype:** and the shortened file type. Moreover, you can only use shortened file types (e.g. typing "powerpoint" instead of "ppt" wouldn't work).

Here is a list of the most common file types indexable by Google:

Common File Types indexable by Google	
Name	Extension
Adobe Portable Document Format	.pdf
HTML	.htm, .html

This search can also be done by using the “[File Type](#)” option in [Advanced Search](#).

1.2.13. Number Range

Occasionally you need to find results within a specific numerical range, such as dates, measurements, or prices. To do this you can use the Number range, by entering your search term, followed by the minimum value, **two dots (..)** and, finally, the maximum value for the range you are searching for. Nevertheless, for this search operator to work properly, it **must be used together with the [Exact Match](#)** operator mentioned above.

EXAMPLE

→ “tuberculosis” 1800..1900

"tuberculosis" 1800..1900

Q All Images News Videos Books More Tools

About 83,300,000 results (0.48 seconds)

https://www.cdc.gov › worldtbday › history

History | World TB Day - CDC

On March 24, 1882, Dr. Robert Koch announced the discovery of Mycobacterium tuberculosis, the bacteria that causes tuberculosis (TB).

Important: there can't be any whitespaces between the **two dots (..)** and minimum and maximum values.

This search can also be done by using the “[All results](#)” feature in [Basic Search Tools](#) (by defining the time range you desire) or the “[Numbers ranging from](#)” option in [Advanced Search](#).

1.2.14. Search Operators Table

Clicking each individual **Operator Name** or **Alternative** will redirect you to the corresponding section.

Google Search Operators				
Operator Name	Operator	Example	More information	Alternative
Exact Match	Quotation marks (" ")	"mitral paravalvular leak"	<p>The quotation marks allow you to only get results for exactly what you type.</p> <p>Important: there shouldn't be any whitespaces between the quotation marks (" ") and the first and last word you type. The group of words you want to search for must be inside the quotation marks (" ").</p>	<p>All results (Verbatim option) in Basic Search Tools or This exact word or phrase in Advanced Search</p>
Multiple Search	AND	"cam latches" AND "cam locks" or "cam latches" "cam locks"	<p>Used to search for websites that contain both terms.</p> <p>Important: there shouldn't be any whitespaces between the quotation marks (" ") and the first/last letters of the words you type. Moreover, the AND should always be capitalized, placed outside of the quotation marks (" ") and between each exact match search.</p>	

	OR	<p>“cam latches” OR “cam locks”</p> <p>or</p> <p>“cam latches” “cam locks”</p>	<p>Used to search for websites that contain at least one of the terms.</p> <p>Important: there shouldn't be any whitespaces between the quotation marks (“ ”) and the first/last letters of the words you type. Moreover, the OR should always be capitalized, placed outside of the quotation marks (“ ”) and between each exact match search.</p>	<p><u>Any of these words</u> in <u>Advanced Search</u></p>
<u>Exclude Content</u>	Hyphen (-)	<p>steel drums -music -instruments</p> <p>sandman -"neil gaiman"</p> <p>tulip -wikipedia.org</p>	<p>Remove content irrelevant to your research. Particularly useful for words with multiple meanings.</p> <p>Important: there shouldn't be any whitespaces between the hyphen (-), the quotation marks (“ ”) (if you use them), and the word/website you wish to exclude. If you wish to exclude multiple words, every one of them must be preceded by a hyphen (-).</p>	<p><u>None of these words</u> in <u>Advanced Search</u></p>
<u>Partial Search</u>	Asterisk (*)	<p>“reverse * lock”</p>	<p>Useful for finding a range of related search results without knowing all the words.</p> <p>Important: the asterisk (*) must be placed in the space where the word you don't know</p>	

			would be. Moreover, there shouldn't be any whitespaces between the first/last letters of the words you type.	
<u>Proximity Search</u>	AROUND(number)	floor AROUND(1) tape	Used to find results that contain two keywords that are closely associated with each other. Important: AROUND should be capitalized and there can't be any whitespaces between AROUND , the number, and the parentheses.	
<u>Domain Search</u>	site:	<p>"machine translation" site:unbabel.com</p> <p>or</p> <p>"cables y alambres" site:es.mouser.com</p> <p>or</p> <p>"medical devices" site:.fr</p>	The Domain Search lets you search for information on a specific website or domain (which may correspond to a certain country) through Google's search engine. Important: don't leave any whitespaces between site: and what follows (URL or dot).	<p><u>Any country</u> in <u>Basic Search</u> <u>Tools</u> or <u>Site or domain</u>, <u>Region</u> or <u>Language</u> in <u>Advanced Search</u></p>
<u>Related Websites</u>	related:	related: facebook.com	This operator allows you to search for websites that are related to a particular website.	

				<p>Important: don't leave any whitespaces between related: and the URL. Moreover, you can only use this for websites (e.g. typing "facebook" after related: wouldn't work).</p>	
<p>Content Placement</p>	<p>Title Search</p>	intitle:	intitle: fastener	Useful to search for websites that have a certain word or phrase in their title.	<p>Terms Appearing in Advanced Search</p>
		allintitle:	allintitle: fastener assortments	<p>Important: there shouldn't be any whitespaces between intitle: or allintitle: and the word(s) or quotation marks (" ").</p>	
	<p>URL Search</p>	inurl:	inurl: electrical	Useful to search for websites that have a certain word or phrase in their URL.	
		allinurl:	allinurl: electrical enclosures	<p>Important: there shouldn't be any whitespaces between inurl: or allinurl: and the word(s) or quotation marks (" ").</p>	
	<p>Text Search</p>	intext:	intext: paddle	Useful to search for websites that have a certain word or phrase in their text.	
		allintext:	allintext: paddle latches	<p>Important: there shouldn't be any whitespaces between intext: or allintext: and the word(s) or quotation marks (" ").</p>	

<p><u>File Type Search</u></p>	<p>filetype:</p>	<p>"electrical engineering" "glossary" filetype:pdf</p>	<p>Allows you to find a specific file type about a particular subject matter and/or within a particular website.</p> <p>Important: there shouldn't be any whitespaces between filetype: and the shortened file type. Moreover, you can only use shortened file types (e.g. typing "powerpoint" instead of "ppt" wouldn't work).</p>	<p><u>File Type</u> in <u>Advanced Search</u></p>
<p><u>Number Range</u></p>	<p>two dots (..)</p>	<p>"tuberculosis" 1800..1900</p>	<p>This operator allows you to find results within a specific numerical range, such as dates, measurements, or prices.</p> <p>Important: there can't be whitespaces between the two dots (..) and minimum and maximum values.</p>	<p><u>Any time</u> (by defining the custom range) in <u>Basic Search Tools</u> or <u>Numbers ranging from</u> in <u>Advanced Search</u></p>

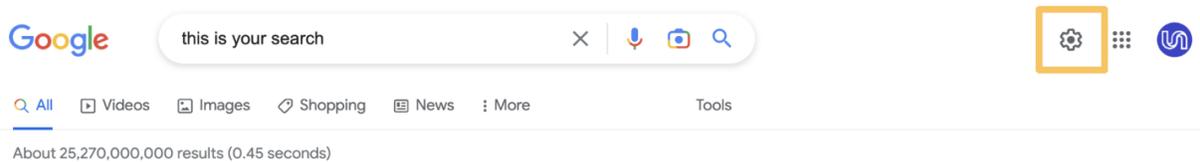

1.3. Advanced Search

Similarly to the other tools we've talked about so far, Google's Advanced Search is a feature that allows you to narrow your search by specifying a set of criteria. Nevertheless, in opposition to [Basic Search Tools](#) or [Search Operators](#), this is done through a particular Google subpage.

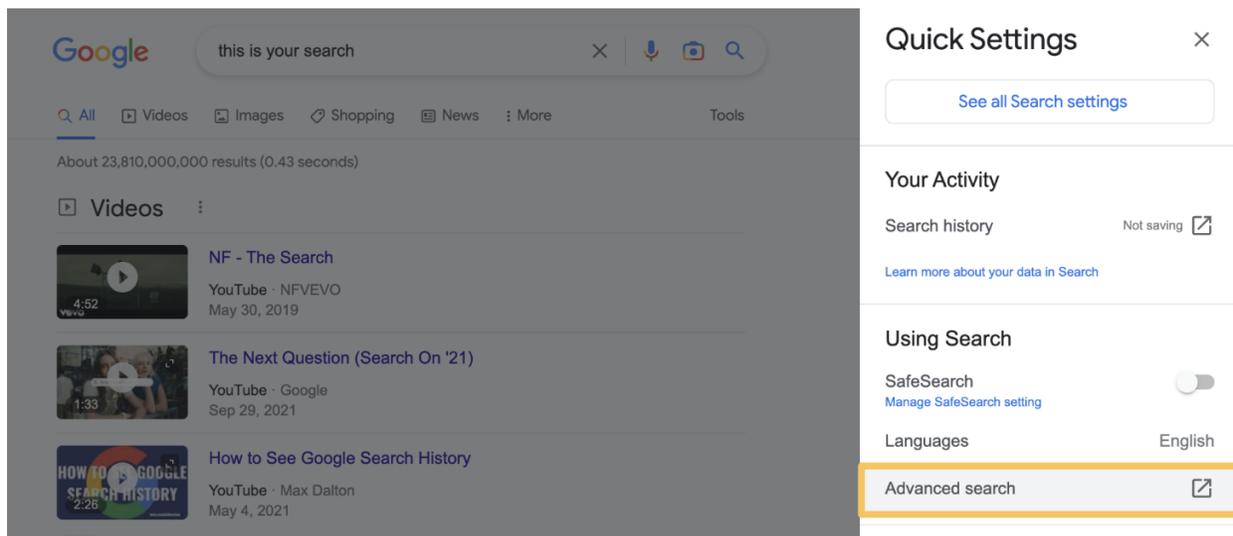

These options will be explained in-depth in the next section. However, if you prefer a broader overview, you can check out the [Advanced Search Table](#).

How to open Google's Advanced Search...

To start using Google's Advanced Search you must open it by clicking on the "Settings" icon in the top right corner of the page.

Next, in the menu that appears you will have to scroll down to the "Using Search" subsection and select "Advanced Search" from the list of options.

This will open the Advanced Search page, where you can determine various search criteria to refine your search. This page is divided into two sections: “Find pages with” and “Then narrow your results by”.

Advanced Search

Find pages with...

Find pages with...		To do this in the search box.
all these words:	<input type="text" value="this is your search"/>	Type the important words: tri-colour rat terrier
this exact word or phrase:	<input type="text"/>	Put exact words in quotes: "rat terrier"
any of these words:	<input type="text"/>	Type OR between all the words you want: miniature OR standard
none of these words:	<input type="text"/>	Put a minus sign just before words that you don't want: -rodent, -"Jack Russell"
numbers ranging from:	<input type="text"/> to <input type="text"/>	Put two full stops between the numbers and add a unit of measurement: 10..35 kg, £300..£500, 2010..2011

Then narrow your results by...

language:	<input type="text" value="any language"/>	Find pages in the language that you select.
region:	<input type="text" value="any region"/>	Find pages published in a particular region.
last update:	<input type="text" value="anytime"/>	Find pages updated within the time that you specify.
site or domain:	<input type="text"/>	Search one site (like wikipedia.org) or limit your results to a domain like .edu, .org or .gov
terms appearing:	<input type="text" value="anywhere in the page"/>	Search for terms in the whole page, page title or web address, or links to the page you're looking for.

1.3.1. Find pages with

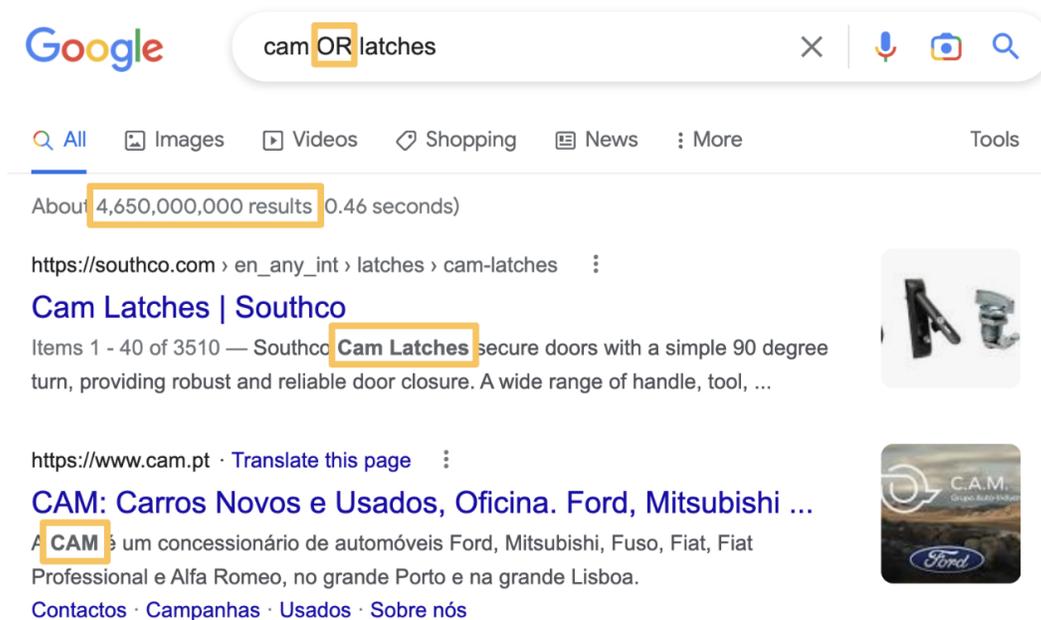

1.3.1.1. All these words

The “All these words” option in Advanced Search allows you to conduct a search that is quite similar to one you would do with only Google. For example, if you perform a simple Google Search for “grommet strips”, you will receive a similar number of results as if you used this option.

This is because this particular feature filters the search results to only include pages that contain all the keywords or phrases specified in this search, in this case, “grommet” and “strips”. However, these keywords or phrases are not necessarily all on the same websites.

you want to locate different terminology within the same text or even verify if a certain thing has several designations. To do this, you can use the “Any of these words” option.

For example, if you search for “cam latches” using this option, you will get a higher number of results than if you did a simple search. This is because this feature will show you not only pages that contain the words “cam latches” together but also websites where the word “cam” or “latches” is present.

The screenshot shows a Google search interface with the search query "cam OR latches" in the search bar. The search results are displayed below the search bar, showing the number of results (4,650,000,000) and the search time (0.46 seconds). The first result is "Cam Latches | Southco" with a thumbnail image of a door latch. The second result is "CAM: Carros Novos e Usados, Oficina. Ford, Mitsubishi ..." with a thumbnail image of a car dealership sign.

Moreover, if you want to define specific groups of words, you can use quotation marks (“ ”) around each group, as seen in the image below.

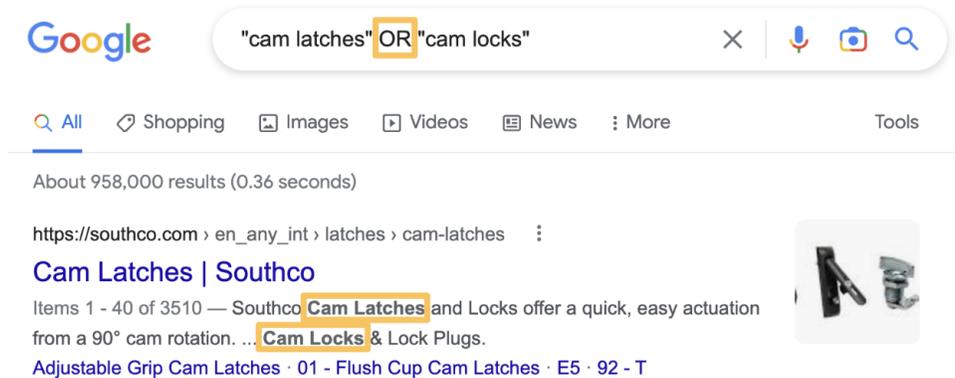

Advanced Search

Find pages with...

all these words:

this exact word or phrase:

any of these words:

The screenshot shows a Google search interface. The search bar contains the query "cam latches" OR "cam locks". Below the search bar, navigation links for All, Shopping, Images, Videos, News, and More are visible. The search results indicate approximately 958,000 results found in 0.36 seconds. The top result is from Southco, titled "Cam Latches | Southco". The snippet for this result mentions "Cam Latches" and "Cam Locks & Lock Plugs". A small image of a cam lock is also visible next to the result.

This can also be done by using the [Multiple Search](#) search operator (OR option).

1.3.1.4. None of these words

As mentioned above in the [Exclude Content](#) section, sometimes there is a need to remove some unrelated content or even unnecessary websites. This can be particularly useful when a word has multiple meanings or when a certain website clogs up your search. To do so, you can use the "None of these words" option.

For example, imagine you're searching for steel drums, you'll mostly get results for the musical instrument and a few containing steel barrels. If you're looking for steel barrels, you can use the "None of these words" option to exclude the words music and instruments.

Advanced Search

Find pages with...

all these words:

this exact word or phrase:

any of these words:

none of these words:

numbers ranging from: to

Moreover, there are times when you might need to exclude multiple words. For example, imagine you are looking for “Sandman”. The main results will be about Neil Gaiman’s comics and their Netflix adaptation.

If you wish to exclude them from your search, you must type the group of words inside quotation marks (“ ”), in this case, “Neil Gaiman”, and then, any single words you wish to exclude, without quotation marks.

Advanced Search

Find pages with...

all these words:

this exact word or phrase:

any of these words:

none of these words:

numbers ranging from: to

In terms of websites, imagine you’re searching for the word tulip. The first result you see is from Wikipedia. However, if you don’t wish to see any Wikipedia pages, you can simply type wikipedia.org. This will remove all the corresponding pages.

Advanced Search

Find pages with...

all these words:	<input type="text" value="tulip"/>
this exact word or phrase:	<input type="text"/>
any of these words:	<input type="text"/>
none of these words:	<input type="text" value="wikipedia.org"/>
numbers ranging from:	<input type="text"/> to <input type="text"/>

This can also be done by using the [Exclude Content](#) operator.

1.3.1.5. Numbers ranging from

Sometimes you need to find results within a specific numerical range, such as dates, measurements, or prices. To do this, you can use the “Numbers ranging from” option.

For example, as mentioned in the [Number Range](#) section, if you search for “tuberculosis”, you will get a larger number of results with various information about it. However, if you want to specify that you want results about tuberculosis during the 19th century, you can use the “numbers ranging from” option by typing the years.

Advanced Search

Find pages with...

all these words:	<input type="text" value="tuberculosis"/>
this exact word or phrase:	<input type="text"/>
any of these words:	<input type="text"/>
none of these words:	<input type="text"/>
numbers ranging from:	<input type="text" value="1800"/> to <input type="text" value="1900"/>

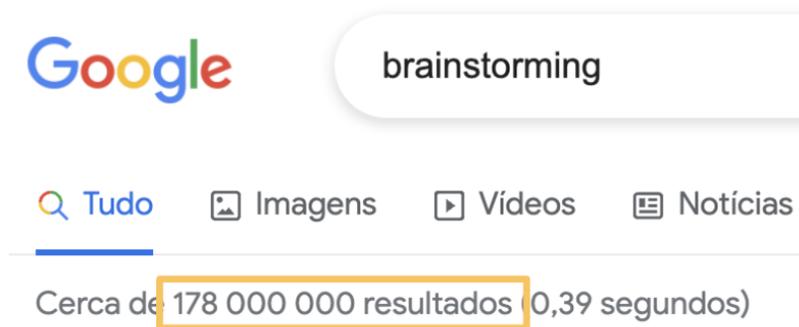

This can also be done by using the [Number Range](#) operator.

1.3.2. Then narrow your results by

1.3.2.1. Language

As a translator, you'll spend a significant amount of time not only searching for terms or information in their original language but also in the language into which you're translating a certain text. You can use this option to pick the language in which you want your results to appear.

For example, as mentioned in the "[Any language](#)" section, imagine you search for the word "brainstorming". You will obtain a large number of results since they contain pages not only in English but also in other languages.

If you wish to search for "brainstorming" in, say, Portuguese, you may first type the word and then pick "Portuguese" from the language drop-down menu. You will not only obtain fewer results but all of them will be in Portuguese.

Find pages with...

all these words:

Brainstorming: o que é e 9 técnicas de como fazer para ter ...

Jul 10, 2019 — **Brainstorming** é um processo criativo que estimula o compartilhamento de ideias e filtra as mais relevantes para o negócio. Veja como fazer!

Similarly, by combining it with another option, namely, “Site or domain”, you will be able to search for a website in a specific language. For example, if you want to find Mouser Electronics’ website in Spanish, choose Spanish from the drop-down box, and then write “mouser.com” in the “Site or domain” option.

Then narrow your results by...

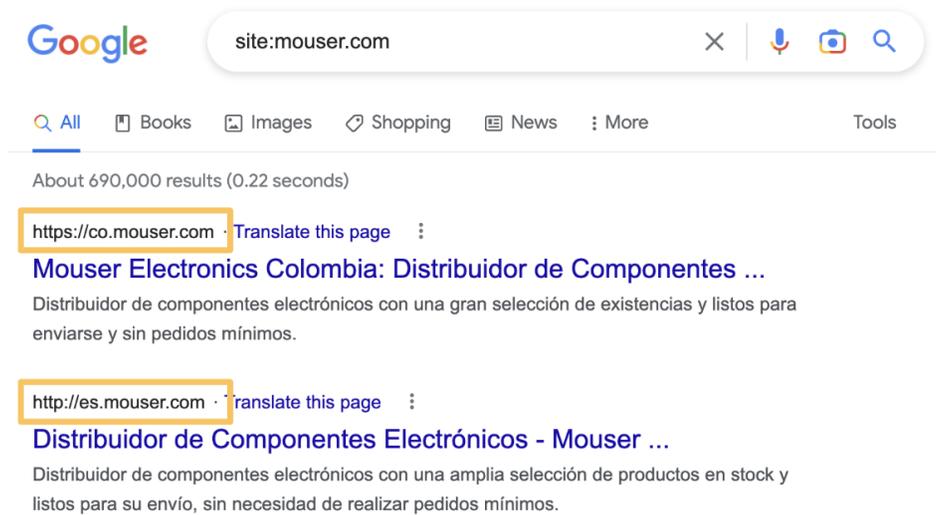

language: Spanish ▼

region: any region ▼

last update: anytime ▼

site or domain: mouser.com

As you can see, doing so will result in various versions of the website. Of course, you must be mindful of the language variety into which you're translating the text and do your research accordingly.

Distribuidor de Componentes Electrónicos - Mouser ...
Distribuidor de componentes electrónicos con una amplia selección de productos en stock y listos para su envío, sin necesidad de realizar pedidos mínimos.

This can also be done by using the “[Any language](#)” feature in Basic Search Tools or using the [Domain Search](#) operator.

1.3.2.2. Region

Occasionally, it becomes necessary to investigate the translation of a word or phrase in a specific country. Particularly when translating into a language that has multiple varieties. The region option can be utilized to accomplish this task.

For example, as seen in the “[Any country](#)” section, if you wish to determine the translation of “ice cream” in European Portuguese and search for something like “ice cream in portuguese”, you will get two distinct results, namely, “sorvete” and “gelado”.

To find out which one is more commonly used in Portugal, you can search for each one of these words separately, while also choosing Portugal as the region in the “Region” drop-down menu.

Find pages with...

all these words:

this exact word or phrase:

any of these words:

none of these words:

numbers ranging from: to

Then narrow your results by...

language:

region:

From the results, you will see that the second word (“gelado”) has more hits in Portugal, which may suggest that it is the more commonly used term for “ice cream” in that country. However, it is important to be cautious when doing this search, as a single word may have multiple meanings, which can affect the number of results.

Moreover, you can also use this option to search for a specific version of a particular website. For example, if you want to find Mouser Electronics’ Portuguese version, you can type the general website’s URL, in this case, “mouser.com”, and then select “Portugal” in the “Region” drop-down menu. Doing this will give you the Portuguese version of the website which is identifiable by its ISO code (more about this in [Domain Search](#)), in this case, “pt”.

Then narrow your results by...

language:

region:

last update:

site or domain:

Google search results for `site:mouser.com`. The search bar shows the query and icons for voice search, image search, and search. Below the search bar are navigation links: All, Books, Images, Shopping, News, More, and Tools. The results show "About 3,220 results (0.21 seconds)". The first result is for `https://pt.mouser.com`, titled "Distribuidor de Componentes Eletrônicos - Mouser Electronics ...". The description reads: "Distribuidor de componentes eletrônicos com ampla seleção de produtos em estoque e prontos para remessa sem quantidades mínimas de componentes."

This can also be done by using the “[Any country](#)” feature in Basic Search Tools or using the [Domain Search](#) operator.

1.3.2.3. Last update

As a translator, it's essential to have access to the most recent and relevant information for your translations, in order to produce accurate and high-quality work. You can accomplish this by limiting your search results to websites that have been updated within a certain time frame, by using the “Last update” option in Google Advanced Search.

For example, during the COVID-19 pandemic, new information about the virus, and its effects was constantly emerging. However, some of this data was conflicting and difficult to verify.

To stay up to date on the latest information, you can use the “Last update” filter in Google’s Advanced Search, by selecting a specific time frame in the drop-down menu, such as the last year, you can narrow down your search results to include only the most recent information.

Then narrow your results by...

language:	any language
region:	any region
last update:	anytime
site or domain:	anytime
terms appearing:	past 24 hours
SafeSearch:	past week
file type:	past month
usage rights:	past year
	any format
	not filtered by licence

This can help ensure that your translations reflect the current understanding of the pandemic, and help you avoid spreading misinformation to the audience you are translating for, which can be essential when working on texts with medical information.

This can also be done by using the “[Any time](#)” feature in Basic Search Tools or using the [Number Range](#) search operator.

1.3.2.4. Site or domain

As mentioned in the [Domain Search](#) section, when translating something related to a particular client, it is important to first check how the content is translated and described on their website. However, oftentimes, it can be challenging to find what you are looking for, due to the website’s complex layout, or lack of a search bar. But the site or domain feature allows you to do this, by restricting the results to the domain you choose.

For example, imagine you want to search for “machine translation” on Unbabel’s website. To do so, you can type “machine translation” in the “This exact word or phrase” option and then, type “unbabel.com” in the “Site or domain” option. As you can see, all the results refer you to Unbabel’s website.

Find pages with...

all these words:

this exact word or phrase:

any of these words:

none of these words:

numbers ranging from: to

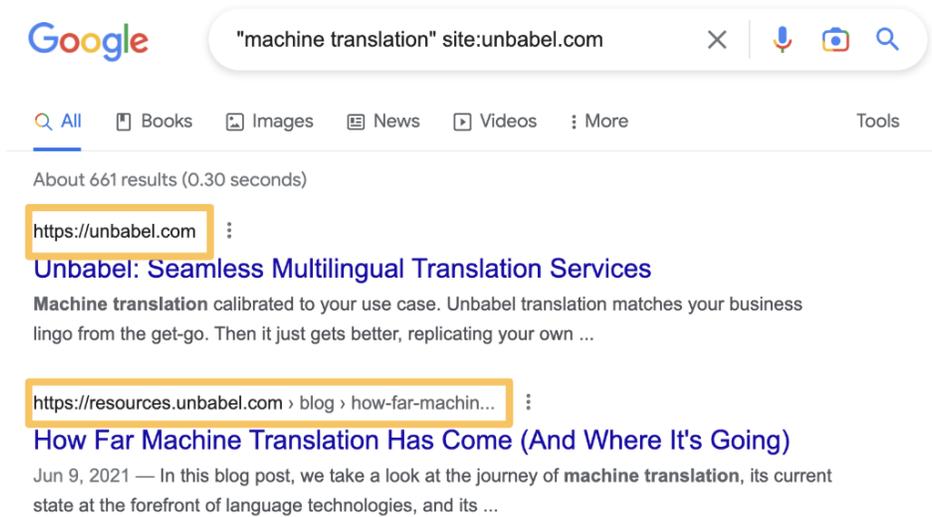

Then narrow your results by...

language:

region:

last update:

site or domain:

The screenshot shows a Google search interface. The search bar contains the query "machine translation" site:unbabel.com. Below the search bar, there are navigation options: All, Books, Images, News, Videos, and More. The search results show "About 661 results (0.30 seconds)". The first result is for "https://unbabel.com" with the title "Unbabel: Seamless Multilingual Translation Services" and a snippet: "Machine translation calibrated to your use case. Unbabel translation matches your business lingo from the get-go. Then it just gets better, replicating your own ...". The second result is for "https://resources.unbabel.com > blog > how-far-machin..." with the title "How Far Machine Translation Has Come (And Where It's Going)" and a snippet: "Jun 9, 2021 — In this blog post, we take a look at the journey of machine translation, its current state at the forefront of language technologies, and its ...".

Additionally, you must be careful if the language you're searching in matches the website's language and variety. For example, if you use the "Site or domain" option to look for "cables and wires" in Spanish on Mouser Electronics' general website, you will get results for multiple versions of the website, including countries with different language varieties, such as Spain and Uruguay.

Consequently, it might be better to specify which version of the website you want to use. The different website versions are usually identifiable by the use of the corresponding country's ISO code or even language ISO code (more about this in [Domain Search](#)). Their format and position in the URL change according to each website. Here is the Spanish version:

Then narrow your results by...

language:	<input type="text" value="any language"/>
region:	<input type="text" value="any region"/>
last update:	<input type="text" value="anytime"/>
site or domain:	<input type="text" value="es.mouser.com"/>
terms appearing:	<input type="text" value="anywhere in the page"/>

Finally, the "Site or domain" option also allows you to search for different country domains without specifying a particular website. This is done, once again, by using the ISO codes, but this time by themselves.

For example, imagine you want to search for french websites about "medical devices". To do so, you should type "medical devices" in the "[This exact word or phrase](#)" option, and then the country's standard ISO code in the "Site or domain" option.

Then narrow your results by...

language:	any language
region:	any region
last update:	anytime
site or domain:	.fr
terms appearing:	anywhere in the page

This can also be done by using the [Domain Search](#) operator.

1.3.2.5. Terms Appearing

Sometimes when you perform a search, you receive a seemingly endless list of results. But the words you were looking for, only appear in a particular area of the website, like the title or the URL. This can be done with the “Terms appearing” option.

For example, as mentioned in the [Content Placement](#) section, imagine you wish to search for websites that have the word “fastener” on their title. To do so, you must type “fastener” and then select the option “title” in the “Terms appearing” dropdown menu.

Find pages with...	
all these words:	fastener
this exact word or phrase:	
any of these words:	
none of these words:	
numbers ranging from:	
	to
Then narrow your results by...	
language:	any language
region:	anywhere in the page
last update:	in the title of the page
site or domain:	in the text of the page
terms appearing:	in the URL of the page
	in links to the page
	anywhere in the page

You can also do the same to search for a group of words, for example, “fastener assortments”. However, while all the results will have the words you’ve defined on their title, they might not be in the order you desire. For this to happen, you must use the [“This exact word or phrase”](#) simultaneously.

The same logic can be applied to the other versions of this filter, namely: URL, text, and link.

terms appearing: **anywhere in the page**

SafeSearch:

file type:

usage rights:

anywhere in the page

in the title of the page

in the text of the page

in the URL of the page

in links to the page

Advanced Search

This can also be done by using the [Content Placement](#) search operator.

1.3.2.6. SafeSearch

This option can be used to filter out inappropriate, offensive or disturbing content while performing a Google search. As a translator, this can be particularly useful to maintain both your standards of quality and your well-being.

For example, if you're working on a legal document, you might use the SafeSearch filter to avoid explicit or offensive content when searching for translations of terms such as "involuntary manslaughter". This is done by choosing the "Hide explicit results" option from the SafeSearch drop-down menu.

SafeSearch: **Show explicit results**

file type:

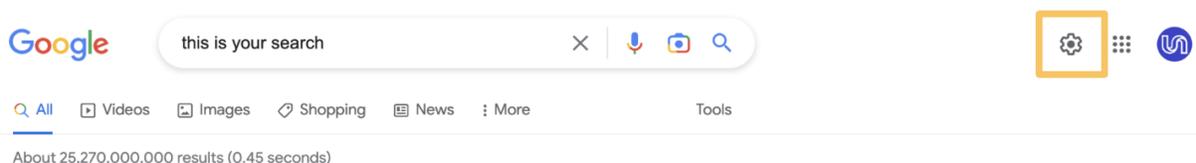

usage rights:

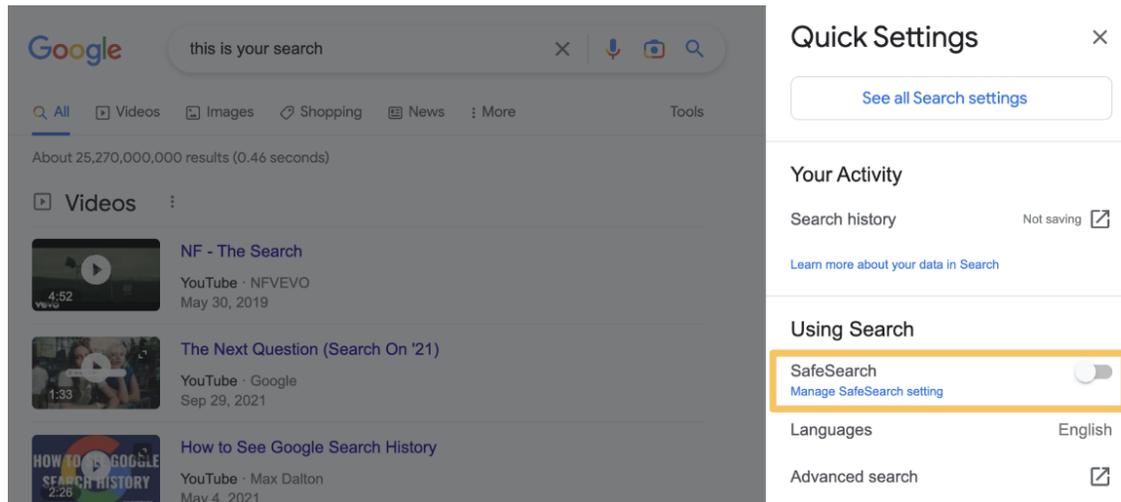

Show explicit results

Hide explicit results

not filtered by licence

Alternatively, you can activate this option in the "Quick Settings" menu. This prevents you from being exposed to potentially triggering or inappropriate content while obtaining access to the information needed for the task at hand.

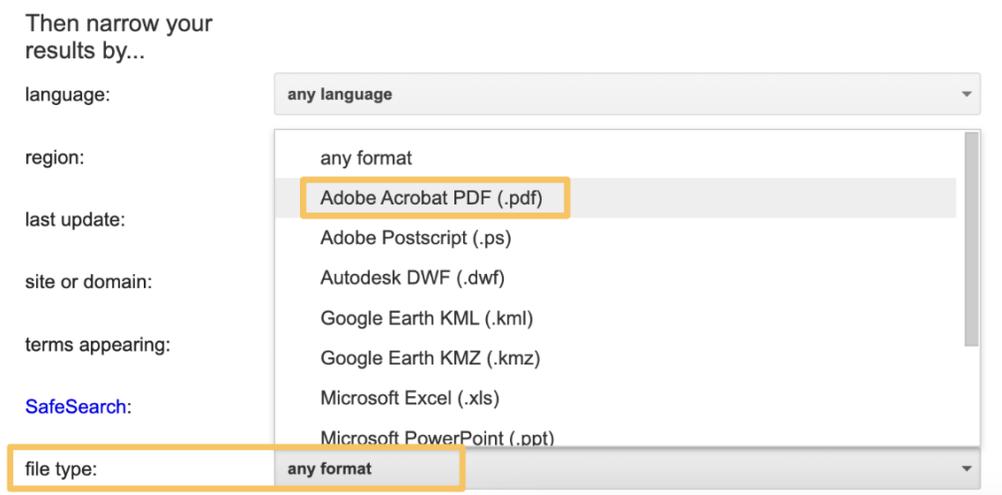

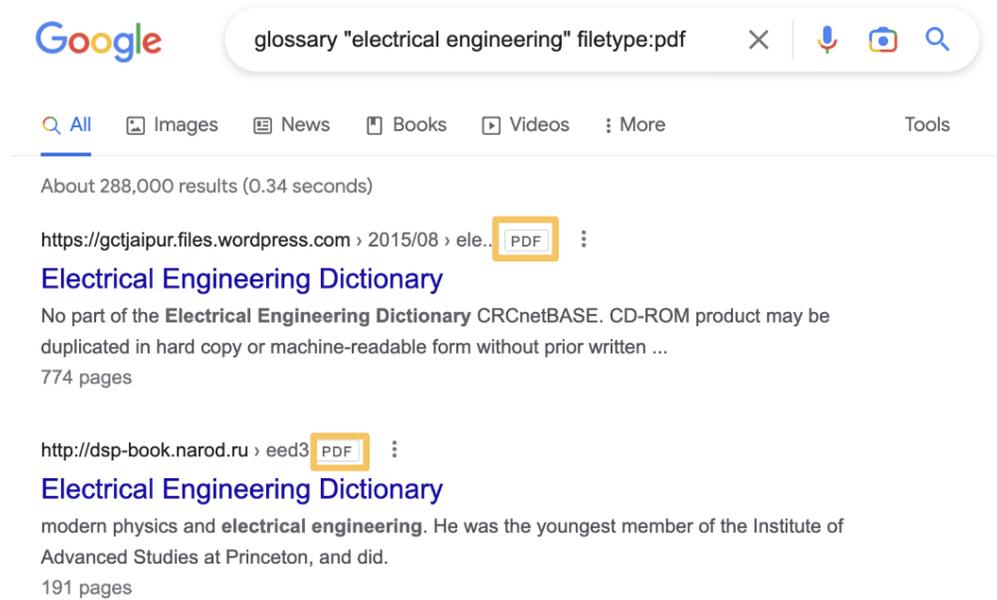

1.3.2.7. File Type

As seen in the [File Type Search](#) section, It is frequently necessary to search for articles on a specific subject or even glossaries on that topic. Many of these are stored in singular files and can be challenging to find because they are typically hidden behind countless pages on a single website. To find them, you can use the “File Type” option in Advanced Search.

For example, imagine you want to search for glossaries about “electrical engineering”. If you do a simple Google search, you will get a large number of results containing only general websites. However, if you only want a PDF file of a glossary, you can type “electrical engineering” and “glossary”, and then select “PDF” in the drop-down menu.

As you can see, all the results will include a little box with the file type.

The screenshot shows a Google search interface. The search bar contains the text "glossary 'electrical engineering' filetype:pdf". Below the search bar, there are navigation options: All, Images, News, Books, Videos, More, and Tools. The search results show "About 288,000 results (0.34 seconds)". Two results are visible, both for "Electrical Engineering Dictionary". The first result is from "https://gctjaipur.files.wordpress.com > 2015/08 > ele.." and has a PDF icon. The second result is from "http://dsp-book.narod.ru > eed3" and also has a PDF icon. Both results include a brief description and the number of pages.
